

ABSTRACT OF THE DISCLOSURE

A attachment method for pressed flowers which includes the steps of:
covering pressed flowers with a layer of transparent resin which becomes
sticky when heated, attaching said pressed flowers to a surface of a base
5 material, and indirectly heating said pressed flowers to make said resin
become sticky thereby firmly adhering said pressed flowers to said base
material without the use of adhesive and therefore making it easier and more
convenient for decoration. It is also very convenient to separate the flower
from the base material and heat it indirectly again to attach to another base
10 material. The resin coating the flowers has the additional benefits of
preventing the pressed flowers from color fading, wear and tear, and extending
their usage.
